

**ADVANCED GCE  
MATHEMATICS**

Mechanics 3

**4730**

Candidates answer on the answer booklet.

**OCR supplied materials:**

- 8 page answer booklet (sent with general stationery)
- List of Formulae (MF1)

**Other materials required:**

- Scientific or graphical calculator

**Monday 24 January 2011  
Morning**

**Duration:** 1 hour 30 minutes

**INSTRUCTIONS TO CANDIDATES**

- Write your name, centre number and candidate number in the spaces provided on the answer booklet. Please write clearly and in capital letters.
- Use black ink. Pencil may be used for graphs and diagrams only.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Answer **all** the questions.
- Do **not** write in the bar codes.
- Give non-exact numerical answers correct to 3 significant figures unless a different degree of accuracy is specified in the question or is clearly appropriate.
- The acceleration due to gravity is denoted by  $g \text{ m s}^{-2}$ . Unless otherwise instructed, when a numerical value is needed, use  $g = 9.8$ .
- You are permitted to use a scientific or graphical calculator in this paper.

**INFORMATION FOR CANDIDATES**

- The number of marks is given in brackets [ ] at the end of each question or part question.
- **You are reminded of the need for clear presentation in your answers.**
- The total number of marks for this paper is **72**.
- This document consists of **4** pages. Any blank pages are indicated.

1

A ball of mass  $0.5 \text{ kg}$  is moving with speed  $22 \text{ m s}^{-1}$  in a straight line when it is struck by a bat. The impulse exerted by the bat has magnitude  $15 \text{ N s}$  and the ball is deflected through an angle of  $90^\circ$  (see diagram). Find

- (i) the direction of the impulse, [3]  
 (ii) the speed of the ball immediately after it is struck. [3]

2 A particle of mass  $0.4 \text{ kg}$  is attached to a fixed point  $O$  by a light inextensible string of length  $0.5 \text{ m}$ . The particle is projected horizontally with speed  $6 \text{ m s}^{-1}$  from the point  $0.5 \text{ m}$  vertically below  $O$ . The particle moves in a complete circle. Find the tension in the string when

- (i) the string is horizontal,  
 (ii) the particle is vertically above  $O$ . [6]

3

A uniform rod  $PQ$  has weight  $72 \text{ N}$ . A non-uniform rod  $QR$  has weight  $54 \text{ N}$  and its centre of mass is at  $C$ , where  $QC = 2CR$ . The rods are freely jointed to each other at  $Q$ . The rod  $PQ$  is freely jointed to a fixed point of a vertical wall at  $P$  and the rod  $QR$  rests on horizontal ground at  $R$ . The rod  $PQ$  is  $2.8 \text{ m}$  long and is horizontal. The point  $R$  is  $1.44 \text{ m}$  below the level of  $PQ$  and  $4 \text{ m}$  from the wall (see diagram).

- (i) Find the vertical component of the force exerted by the wall on  $PQ$ . [2]  
 (ii) Hence show that the normal component of the force exerted by the ground on  $QR$  is  $90 \text{ N}$ . [2]  
 (iii) Given that the friction at  $R$  is limiting, find the coefficient of friction between the rod  $QR$  and the ground. [5]

4

Two uniform smooth spheres  $A$  and  $B$  of equal radius are moving on a horizontal surface when they collide.  $A$  has mass  $0.4$  kg and  $B$  has mass  $0.3$  kg. Immediately before the collision  $A$  is moving with speed  $7$  m s<sup>-1</sup> at an acute angle  $\theta$  to the line of centres, where  $\cos \theta = 0.6$ , and  $B$  is moving with speed  $2.8$  m s<sup>-1</sup> along the line of centres (see diagram). The coefficient of restitution between the spheres is  $0.7$ . Find

(i) the speed of  $B$  immediately after the collision, [6]

(ii) the angle turned through by the direction of motion of  $A$  as a result of the collision. [5]

5 A particle  $P$  of mass  $0.05$  kg is suspended from a fixed point  $O$  by a light elastic string of natural length  $0.5$  m and modulus of elasticity  $2.45$  N.

(i) Show that the equilibrium position of  $P$  is  $0.6$  m below  $O$ . [3]

$P$  is held at rest at a point  $0.675$  m vertically below  $O$  and then released. At time  $t$  s after  $P$  is released, its downward displacement from the equilibrium position is  $x$  m.

(ii) Show that  $\frac{d^2x}{dt^2} = -98x$ . [3]

(iii) Find the value of  $x$  and the magnitude and direction of the velocity of  $P$  when  $t = 0.2$ . [7]

[Questions 6 and 7 are printed overleaf.]

6

A particle  $P$ , of mass  $3.5$  kg, is in equilibrium suspended from the top  $A$  of a smooth slope inclined at an angle  $\theta$  to the horizontal, where  $\sin \theta = \frac{40}{49}$ , by an elastic rope of natural length  $4$  m and modulus of elasticity  $112$  N (see diagram). Another particle  $Q$ , of mass  $0.5$  kg, is released from rest at  $A$  and slides freely downwards until it reaches  $P$  and becomes attached to it.

- (i) Find the value of  $V^2$ , where  $V$  m s<sup>-1</sup> is the speed of  $Q$  immediately before it becomes attached to  $P$ , and show that the speed of the combined particles, immediately after  $Q$  becomes attached to  $P$ , is  $\frac{1}{2}\sqrt{5}$  m s<sup>-1</sup>. [6]

The combined particles slide downwards for a distance of  $X$  m, before coming instantaneously to rest at  $B$ .

- (ii) Show that  $28X^2 - 8X - 5 = 0$ . [6]

7 A particle  $P$  of mass  $0.2$  kg is released from rest at a point  $O$  and falls vertically. Air resistance of magnitude  $\frac{v^2}{2000}$  N acts upwards on  $P$ , where  $v$  m s<sup>-1</sup> is the velocity of  $P$  when it has fallen a distance of  $x$  m.

- (i) Show that  $\left(\frac{400v}{3920 - v^2}\right) \frac{dv}{dx} = 1$ . [2]

- (ii) Find  $v^2$  in terms of  $x$  and hence show that  $v^2 < 3920$  for all values of  $x$ . [7]

- (iii) Find the work done against the air resistance while  $P$  is falling, from  $O$ , to the point where its downward acceleration is  $5.8$  m s<sup>-2</sup>. [6]
